National Metrology Institute of Japan

Reference Material Certificate
NMIJ CRM 8203-a
No. +++

Lead-Free Solder Chip (Sn96.5 Ag3 Cu0.5) – Pb High Concentration

This certified reference material (CRM) was produced in accordance with the NMIJ’s management system, and in compliance with ISO GUIDE 34:2000 and ISO/IEC 17025:2005. This CRM is intended for use in controlling the precision of analyses and validating analytical methods and instruments used in the quantitative analysis of Pb, Ag, and Cu in a tin-based lead-free solder containing Ag and Cu.

Certified Values
The certified values of Pb, Ag, and Cu in this CRM are given in the table below. This CRM should be used without being dried. The uncertainty of the certified value is the half-width of the expanded uncertainty interval calculated using a coverage factor (k) of 2, which gives a level of confidence of approximately 95%.

<table>
<thead>

</table>

Analysis
Each certified value of this CRM was determined as a weighted mean of three results. The following analytical methods were used:
1) Hydrofluoric acid - nitric acid digestion / isotope dilution - inductively coupled plasma mass spectrometry,
2) Hydrofluoric acid - nitric acid digestion / inductively coupled plasma mass spectrometry, and
3) Sulfuric acid - nitric acid digestion / inductively coupled plasma optical emission spectrometry.

Metrological Traceability
Each certified value of this CRM is determined by more than one method including the isotope dilution – mass spectrometry, which is the primary method of measurement, with the NMIJ primary standard solutions and the NIST SRM standard solution of Ag. The certified values are traceable to the International System of Units (SI). Each certified value is determined with the NMIJ primary standard solutions, the JCSS (Japan Calibration Service System) standard solutions, or the NIST SRM standard solutions.

Indicative Values
The indicative values of several kinds of trace metals in this CRM are given in the Table below. Each value following the symbol “±” in the indicative value columns is the expanded uncertainty determined with a coverage factor (k) of 2.
**Element** | **Indicative value, mass fraction (mg/kg)** | **Analytical method** (*vide infra*)
---|---|---
Sb | 1.85 ± 0.12 | 1) Hydrofluoric acid - nitric acid digestion followed by anion exchange / isotope dilution - inductively coupled plasma mass spectrometry,
Bi | 0.60 ± 0.08 | 2) Sulfuric acid - nitric acid digestion followed by vaporization separation of tin(IV) bromide / graphite-furnace atomic absorption spectrometry,
In | 0.45 ± 0.04 | 3) Hydrofluoric acid - nitric acid digestion / matrix matching - inductively coupled plasma optical emission spectrometry.
Al | ≤ 2.3 (LOD) | 3) Sulfuric acid - nitric acid digestion followed by vaporization separation of tin(IV) bromide / graphite-furnace atomic absorption spectrometry.
As | ≤ 24 (LOD) | 3) Hydrofluoric acid - nitric acid digestion / matrix matching - inductively coupled plasma optical emission spectrometry.
Au | ≤ 5.4 (LOD) | 3) Hydrofluoric acid - nitric acid digestion / matrix matching - inductively coupled plasma optical emission spectrometry.
Cd | ≤ 0.44 (LOD) | 3) Hydrofluoric acid - nitric acid digestion / matrix matching - inductively coupled plasma optical emission spectrometry.
Cr | ≤ 3.2 (LOD) | 3) Hydrofluoric acid - nitric acid digestion / matrix matching - inductively coupled plasma optical emission spectrometry.
Fe | ≤ 0.32 (LOD) | 3) Hydrofluoric acid - nitric acid digestion / matrix matching - inductively coupled plasma optical emission spectrometry.
Hg | ≤ 1.5 (LOD) | 3) Hydrofluoric acid - nitric acid digestion / matrix matching - inductively coupled plasma optical emission spectrometry.
Ni | ≤ 0.69 (LOD) | 3) Hydrofluoric acid - nitric acid digestion / matrix matching - inductively coupled plasma optical emission spectrometry.
Zn | ≤ 28 (LOD) | 3) Hydrofluoric acid - nitric acid digestion / matrix matching - inductively coupled plasma optical emission spectrometry.

LOD: limit of detection

*Analytical method
1) Hydrofluoric acid - nitric acid digestion followed by anion exchange / isotope dilution - inductively coupled plasma mass spectrometry,
2) Sulfuric acid - nitric acid digestion followed by vaporization separation of tin(IV) bromide / graphite-furnace atomic absorption spectrometry,
3) Hydrofluoric acid - nitric acid digestion / matrix matching - inductively coupled plasma optical emission spectrometry.

Expiration of Certification
The certification of this CRM is valid until March 31, 2020, provided that the material remains unopened and is stored in accordance with the instructions given in this certificate.

Sample Form
This CRM is in the form of small wire chips. The small wire chips with a net mass of 50 g are sealed in a plastic bag, which is kept in a plastic bottle.

Homogeneity
The homogeneity of the metal elements in the CRM was determined by analyzing 10 bottles selected in order of bottling with the stratified random sampling method. The concentration of the elements (Pb, Ag, and Cu) was determined by the hydrofluoric acid - nitric acid digestion / internal standard - inductively coupled plasma optical emission spectrometry. The homogeneity of each element has been incorporated into the uncertainty of the certified value. This CRM is homogeneous within the range of the uncertainty of the certified values.

Instructions for Storage
This CRM should be kept in a clean place at a temperature between 15 °C and 35 °C and should not be exposed to direct sunlight.

Instructions for Use
This CRM should be used without being dried or washed. The bottles should be allowed to warm to room temperature before opening. To maintain the homogeneity, sample mass of at least 0.20 g should be used for each analysis. For the purpose of air-buoyancy correction, the density of the material can be assumed to be 7.2 g/cm³.

Precautions for Handling
Refer to the safety data sheet (SDS) on this CRM before use.
Preparation Method
Base materials of this CRM were melted, casted in a mold, and promptly cooled to produce billets. The billets were extruded in a step-by-step way into wires with a diameter of 1 mm, and then cut into 1 mm x 1 mm chips. The chips of 50 g in net mass were packaged in a plastic bag under vacuum.

NMIJ Analysts
The technical manager and the production manager for this CRM is A. Hioki, and the analysts are N. Nonose and A. Hioki.

Technical Information
Customer registration on the NMIJ Website (given below) will facilitate notification of any revision of the information given above. Technical reports regarding this CRM can be obtained from the contact details given below.

Reproduction of Certificate
In reproducing this certificate, it should be clearly indicated that the document is a copy.
